

OPERATIVE REPORT - SUMMARY

Date of surgery: 2026-04-01

Pre-operative diagnosis: Complete rupture of the anterior cruciate ligament, right knee.

Post-operative diagnosis: Same.

Procedure performed: Arthroscopic-assisted anterior cruciate ligament reconstruction, right knee, using bone-patellar tendon-bone autograft.

Diagnostic arthroscopy confirmed intact menisci; no additional procedures required.

Anesthesia: General, uneventful. Estimated blood loss minimal. Patient tolerated the procedure well without intraoperative complication.

Plan: Hinged knee brace locked in full extension at all times. Toe-touch weight-bearing only on the operative leg for the first two weeks. Follow up in clinic in 10-14 days for wound check and suture removal.
