

PHYSICAL THERAPY PROGRESS NOTE - Week 4 Post-Op

Subjective: Patient reports the knee has been more swollen than usual over the past three days, particularly after home exercises. Denies fever, warmth, or drainage.

Objective: Effusion increased compared to last visit. Active knee flexion now 110 degrees. Quad activation improving with visible contraction on straight-leg raise.

Assessment: Persistent post-exercise effusion - will reduce exercise intensity this week and monitor closely. Full weight-bearing without crutches approved by surgeon.

Plan: Discontinue crutches; full weight-bearing without assistive device. Continue closed-chain strengthening within pain-free range only.
