

PHYSICAL THERAPY PROGRESS NOTE - Week 8 Post-Op

Subjective: Swelling from prior visits has resolved. Patient reports mild anterior knee pain with kneeling and stair descent, otherwise feeling well.

Objective: Achieved 120 degrees of active knee flexion today, a new milestone for this patient. Continues to avoid full weight-bearing squats per surgeon's restriction pending 12-week clearance.

Assessment: Anterior knee pain with loaded knee flexion - monitoring for patellofemoral involvement. Otherwise progressing on schedule.

Plan: Begin closed-chain strengthening progression. Continue to avoid full weight-bearing squats until 12-week clearance.
